Your doctor highly recommends you have an Optomap® Retinal Exam, as part of your annual comprehensive eye exam. The Optomap generates an instantaneous, ultra-wide digital scan of your retina, assisting your doctor in detecting any signs of eye disease. The Optomap is fast and comfortable for patients of all ages. The test takes only minutes to perform, capturing a 200 degree view of your retina in only a quarter of a second. The Optomap is especially helpful to your doctor because it provides a permanent baseline record of the condition of your retina for comparison during your future eye exams.

The Optomap technology was invented by Douglas Anderson, whose then 5-year-old son, Leif, lost sight in one eye due to a retinal problem that went undetected. Although Leif was having regular eye exams, conventional tests are uncomfortable, especially for small children, making it difficult for the doctor to conduct a thorough examination. Douglas designed the Optomap Retinal Exam to make retinal exams easier for both patients and doctors and to help others avoid the unnecessary vision loss experienced by his son.

The Optomap Retinal Exam is a valuable tool your doctor can use to educate you about your health and wellness. It provides you and your doctor with an opportunity to interactively re-view and discuss the results of your examination. Your doctor will educate you on the various structures of your retina and explain treatment options for any conditions revealed by the exam. The more knowledgeable you are, the easier it is to understand and follow your doctor’s recommendations for treatment and prevention.
